Continuation of 3. NOTE: the issue of automated converance and the placement of the coating on the readout side (independent claims) and a computer including programming (claims 50 and 24) are newly presented. The current language allows non-automated means for conveyance and the coating to be on the non-readout side.

Continuation of 11. does NOT place the application in condition for allowance because: Were the amendment to be entered the 112 rejections would be obviated and the rejections not including both Krasulak et al. and Gaudiana et al. would be overcome. Exampel 6 of Gaudiana et al. uses both a xenon arc and a mercury lamp, so these are not the same exposure source and the disk would have to be moved between them. The Krasulak et al. and Grossa et al. references teach compostions which both photocure and photocolor through the use of two wavelengths. This is congruent with the two wavelength teachings of Gaudianan for photocoloration. The rejections make it clear what modifications of the primary references are assetted in the rejections and provide a basis for a reasonable expectation of success of functionality when the substitution is made. The applicant fails to apprecaite that the embodiments of figures 2,40, and 77 coat the reflective layer upon the embossed data, which allows the readout from the substrate side (actually either side) and no recording layer is described relative to the reflective layer (which controls the access by the light) such that the medium is neccessarily topside read..
